

Overview

Our team has been involved with the specification and manufacture of control panels for the satellite and telecommunication industry for many years, from motor control, duct control, switch control, alarm monitoring and Remote Control & Monitoring (RC&M) interface applications. We offer a tailored approach to panel and box building whether it is a simple interconnect or a more complex control and monitor requirement.

We offer 19" rack mount, desktop and wall mount enclosures of various sizes custom wired to your application.

With an in house 3D design capability we can ensure the panel will be fit for purpose before an assembly takes place, combine this with our experience in satcomms and electrical & electronic engineering we are well placed to deliver a quality solution within our systems.

Our panels/box assemblies cater for DIN rail mountable and non DIN rail components and can include a variety of components such as transformers, inverters, timers, relays, i/o modules and power supplies. We can also offer solutions where equipment actuation or status reporting is via Ethernet from a remote location.
