

Overview

At Kratos we have wide ranging experience of NOCs and Control Centres for various applications such as Satellite Control (SCCs), Datacentre and Broadcast Network Operation (NOC). We understand that these important hubs of activity are critical to our customers success.

There is a need for bespoke designs to meet the monitoring and environmental requirements for efficient operation of the network. We work with our customers to analyse UML cases, network SLAs, customer preferences and experience to develop an environment that is optimised for their needs.

We provide the design and consultation service and capability to enable customers to maximise the space they have available to produce a professional operating environment that they are proud to show their customers.

We can offer bottom up designs or upgrade/expansion of existing facilities

Our technical furniture and display solutions and designs provide a professional, clean look solution to enable the specified number of operators to work in a comfortable environment.

Together with our Monitoring & Control, Satellite TT&C, TVRO, CSM and broadcast solution we can offer a customer a full end to end system integration package for their network.

Typical Control room environments include the integration of: Multi-display client consoles for NMS and EMS software, TV walls, Multiviewers, speakers systems, RF monitoring and test equipment, house keeping systems and control panels to provide a fully centralised operations environment.
